Description

When users access invalid or non-existent category URLs, the application displays a network error instead of a proper 404 page.

Steps to Reproduce:

1. Access an invalid category URL, example: /category/invalid-category-123

2. Or access a deleted category

3. Observe the application response

Expected Result:

• Application displays a user-friendly 404 Not Found page

• Clear error message: "Category not found"

• Suggestion to navigate back to main category page

• Proper HTTP 404 status code

Actual Result:

Application displays a network error or unclear error message, not a standard 404 page.

Impact:

• Poor user experience

• Negative impact on SEO

• Users are confused and don't know the next steps
